

## T1-1 The Field of Perception As A Social Market Place

The *Host*(1) person perceives the social market place. The *Host*(1) is coalesced with *Conscious Knowledge*(2) which is subjectively aligned with *Emotional Knowledge*(3) as it is coalesced with *Routines*(4) via the limbic system. The *Host*(1) thus *Knows*(2) *Emotional*(3) *Routines*(4), the latter being objectively aligned with the *Host*(1). Since limbic emotional patterns project to the Primary Sensory cortex of the new brain, the person knows a subjective urge to express an act recalled from the Void, within the context of the physical *Form*(5) of the body and the world at large. In the regenerative mode (1) and (2) change places. The *Host*(1) is now on the subjective side of the axis and aligned with limbic *Emotions*(3) as they relate objectively to *Routines*(4) aligned with *Consciousness*(2). This indicates a motor simulation of behavioural *Routines*(4) in the gamma motor neurons of the spinal cord that initiates in the reticular formation associated with conscious arousal.  $P_{1,2,3,4}$  projections relate to the physical social marketplace in the expressive mode and project to the body's muscle spindles that generate proprioceptive sensory input in the Term 4R that follows in the sequence. The *person*(1) *knows*(2) an *urge*(3) to respond in a patterned *routine*(4) perceived as a need. This does not assess the Host person's capacity to act. A person may feel a need for a new car but may or may not have the money to buy one.
